

### Abstract

The present invention is to provide an electro-magnetic wave shielding material which comprises a trans-parent substrate and a fine line pattern formed thereon, 5 wherein the fine line pattern comprises a metal plating film using a physically developed metal silver as a catalytic nucleus and

a process for preparing an electromagnetic wave 10 shielding material which comprises exposing a light-sensitive material having a physical development nuclei layer and a silver halide emulsion layer on a transparent substrate in this order, precipitating metal silver with an optional fine line pattern onto the physical development 15 nuclei layer by physical development, then, removing a layer provided on the physical development nuclei layer, and subjecting to plating a metal with the use of the physically developed metal silver as a catalytic nucleus
